

## TECHNICAL REPORT ABOUT THE MAINTENANCE OF THE SUPPLEMENTARY FEEDING STATIONS IN ALBANIA Spring 2019

Since may this year, both Supplementary Feeding Stations (SFS) are operating in Albania; the one of Glina constructed in 2017 and the one of Nivica, constructed in in July 2018.

PPNEA has contracted two locals for the feeding and maintenance of the SFS.

The supplementary feeding station of Glina has been supplied 3 times along this year, with a total amount of around 80 kg of meat remains. The first feeding was composed by an old ram which attracted vultures immediately. In an interval of around 3 weeks after the first meal, the station has been feed twice more with around 25 kg of meat remains from the slaughter house of Gjirokaster. In addition the SFS of Nivica has been fed twice with an interval of 3-4 weeks between each feeding, with a total amount of 40 kg of meat remains from the slaughter house of Gjirokaster.

The station of Glina is monitored by camera trap, which confirms that it is regularly visited so far by three different individuals. The pair of Peshkpi-Radat and the single individual of Vllaho-Goranxi. In addition, this station is visited by Ravens and Hooded Crows.

The station of Nivica is not monitored by camera trap, therefore we do not know if this station is visited or not. We will install another camera trap soon, as the first one we gave to install has lost.

Bellow there are found photos of both SFSs, a map showing where are situated and few photos of birds visiting the SFS of Glina.
